

25 Abstract

 The invention relates to a valve (10, 110) having a
valve chamber (14, 114), having at least one inlet conduit
(16, 116) and one outlet conduit (18, 118), furthermore
having a movable lifting rod (34, 134), one end of which
30 opens into an actuator (53), and having at least one valve
member (36, 136, 236) secured to the lifting rod (34, 134),
and having at least one valve seat (22, 122) cooperating with
the valve member (36, 136, 236).

 It is proposed that the valve seat (22, 122) and/or
35 valve member (36, 136, 236) is elastically deformable in such
a way that the elasticity of the valve seat (22, 122) and/or
valve member (36, 136, 236) is at least so great that the
valve member (36, 136, 236) can be thrust through the valve
seat (22, 122) by an in particular external exertion of force
40 and that the valve seat (36, 136, 236) and the valve member
(22, 122) return to their outset state.
